# AWS IAM Hands-on Lab Tasks (1-7)

## Task 1: IAM User with Console Access

**Objective:** Create an IAM user with Management Console access, force a password change at first login, attach the ReadOnlyAccess policy, log in using the new user, and verify that resources can be viewed but not modified.

**What to do:** Complete the configuration, test both successful and denied operations where applicable, and record your observations with screenshots.

**Learning Outcome:** IAM users, console authentication, managed policies.

## Task 2: IAM User without Console Access (AWS CLI)

**Objective:** Create a CLI-only IAM user, generate an access key, configure the AWS CLI using the credentials, verify your identity with STS, and list EC2 instances or S3 buckets.

**What to do:** Complete the configuration, test both successful and denied operations where applicable, and record your observations with screenshots.

**Learning Outcome:** Access keys, AWS CLI authentication.

## Task 3: Create a Custom IAM Policy

**Objective:** Create a JSON policy that allows listing and reading S3 buckets but prevents bucket deletion. Attach it to a user and test both allowed and denied actions.

**What to do:** Complete the configuration, test both successful and denied operations where applicable, and record your observations with screenshots.

**Learning Outcome:** Custom policies, least privilege.

## Task 4: EC2 Read-Only Access

**Objective:** Provide only EC2 read permissions to a user. Confirm they can view instances, volumes, and security groups but cannot start, stop, or terminate instances.

**What to do:** Complete the configuration, test both successful and denied operations where applicable, and record your observations with screenshots.

**Learning Outcome:** Read-only permissions.

## Task 5: Start and Stop EC2 Only

**Objective:** Create a custom policy allowing DescribeInstances, StartInstances, and StopInstances. Verify launching or terminating instances is denied.

**What to do:** Complete the configuration, test both successful and denied operations where applicable, and record your observations with screenshots.

**Learning Outcome:** Action-level permissions.

## Task 6: IAM Role for EC2

**Objective:** Create an IAM role with S3 read-only permissions, attach it to an EC2 instance, and access AWS services from the instance without configuring access keys.

**What to do:** Complete the configuration, test both successful and denied operations where applicable, and record your observations with screenshots.

**Learning Outcome:** IAM roles, temporary credentials.

## Task 7: Access S3 from EC2 Using IAM Role

**Objective:** Create an S3 bucket, upload sample files, use the EC2 IAM role to list and download objects, then verify uploads fail because only read access is granted.

**What to do:** Complete the configuration, test both successful and denied operations where applicable, and record your observations with screenshots.

**Learning Outcome:** Using IAM roles with EC2 and S3.
