AWS Cloud Practice – Day 01

Date: November 7, 2026
Topic: AWS Account Security, Billing Alerts and CLI Setup

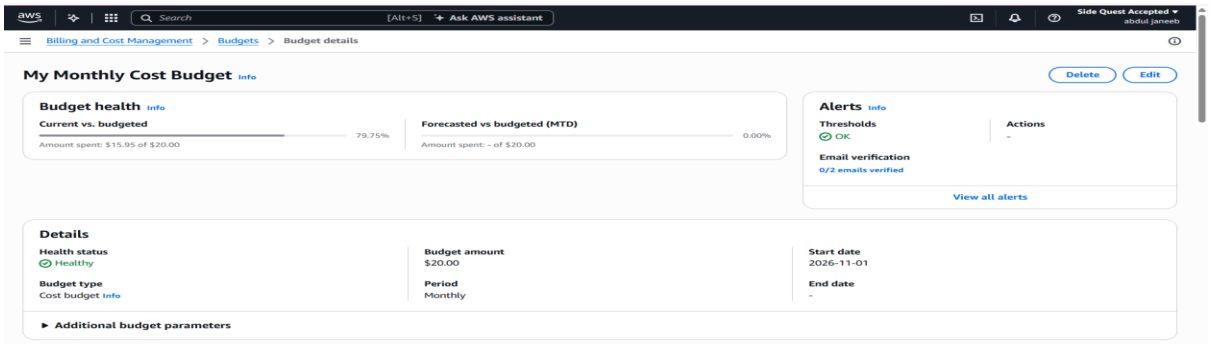

- Exploring Cost Management

- Created an AWS monthly cost budget

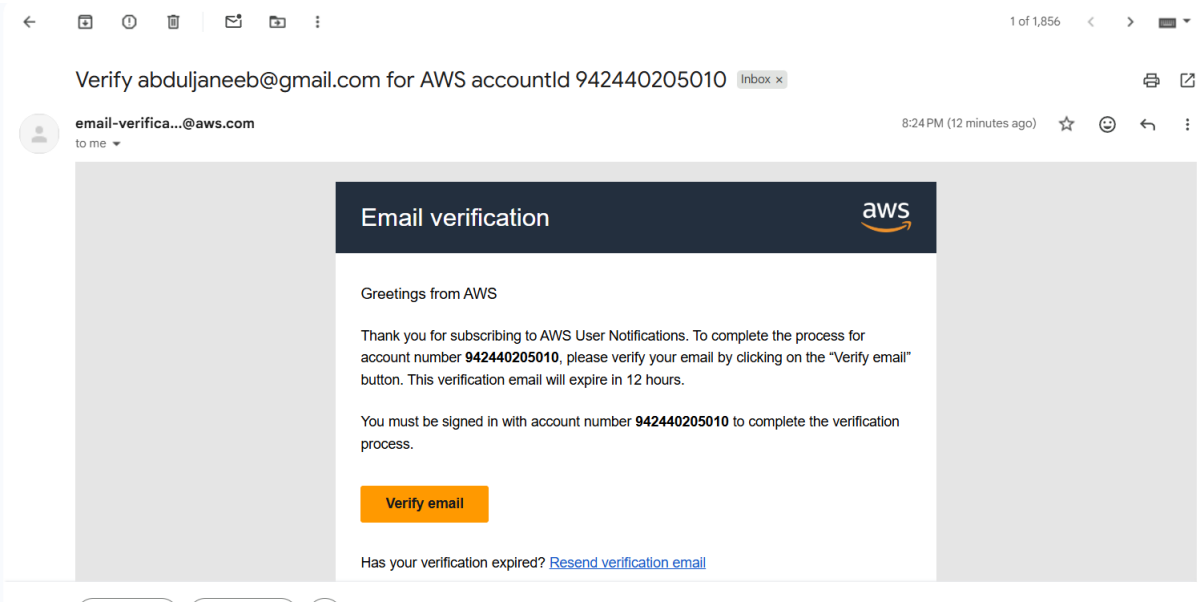

- Set a $20 spending threshold

ABDUL JANEEB K

- Configured email notification

Learned how aws help control and monitor cloud spending.

MFA:- (multi factor authentication)

MFA stands for Multi-Factor Authentication.

Normally, you log in using:

- Email address
- Password

With MFA, AWS also asks for a temporary verification code from an authenticator app.

Even if someone steals your password, they cannot easily access your AWS account without the second authentication factor.

Why is MFA important?

- Protects AWS accounts from unauthorized access.
- Adds an extra layer of security if passwords are compromised.
- Helps secure sensitive AWS resources.
- Reduces the risk of account compromise.

MFA Authentication Process:

1. Enter AWS username and password.
2. Open an authenticator application.
3. Generate a temporary verification code.
4. Enter the code to complete authentication.

MFA Device Types:

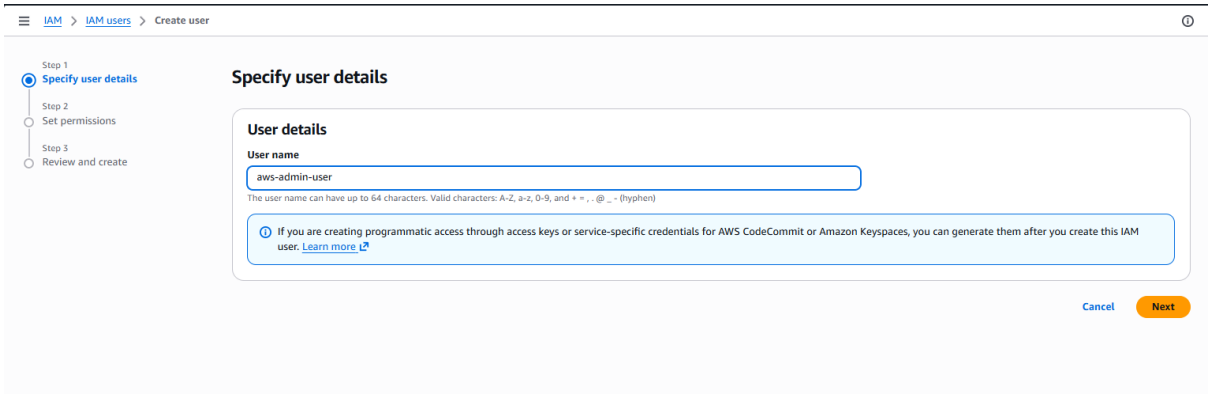

- Virtual MFA devices (Google Authenticator, Microsoft Authenticator).
- Hardware MFA devices.
- Security keys.

Practical Learning:

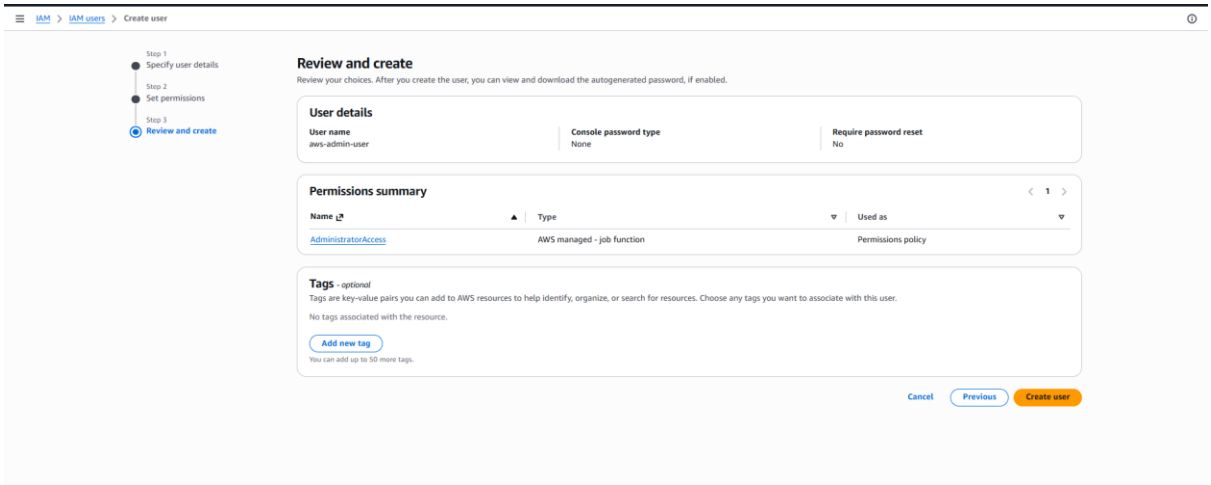

- Studied the MFA configuration process through a practical demonstration.
- Learned how to assign an authenticator app to an AWS account.
- Explored the difference between Root User MFA and IAM User MFA.

- **Task 3 – Create an IAM Administrator User.**

Such as

- Policy added AdministratorAcess
- It provide full acess to AWS services and resources such as EC22,S3 etc

Objective: Create an IAM user with administrator permissions and configure AWS Console access.

Steps performed:

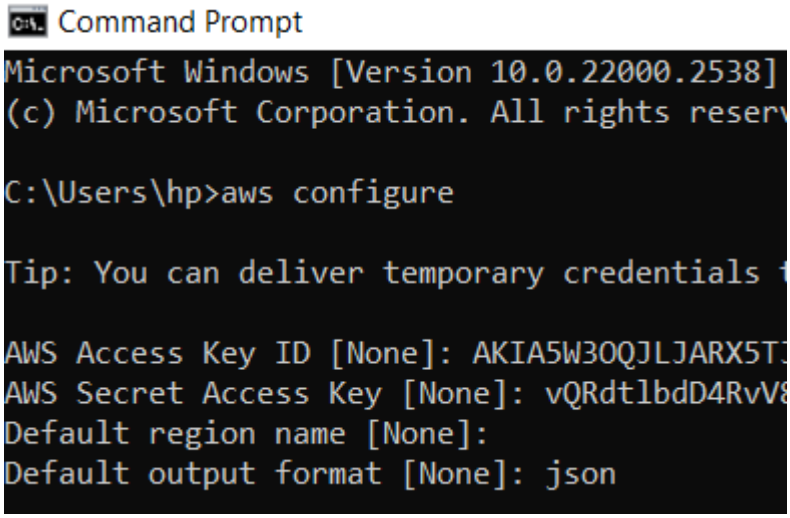

1. **Open AWS Management Console.**
2. **Navigate to IAM → Users → Create user.**
3. **Enter username: aws-admin-user.**
4. **Select Provide user access to the AWS Management Console.**
5. **Configure the console password.**
6. **Select Attach policies directly.**
7. **Search for and select AdministratorAccess.**

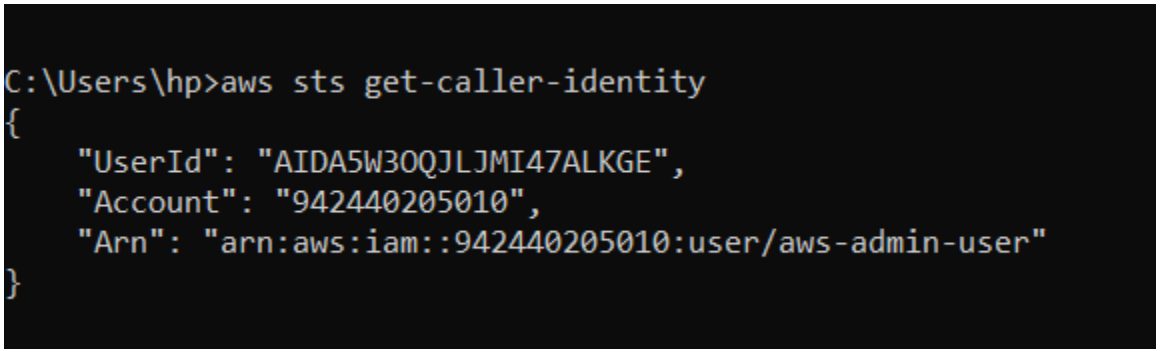

8. **Review the configuration and create the user.**
9. **Verify that the AdministratorAccess policy is attached.**

Testing:

1. **Open the IAM sign-in URL in an Incognito browser window.**
2. **Enter the IAM username and password.**
3. **Log in to the AWS Management Console.**
4. **Verify administrator access.**

Task 5 – Configure AWS CLI

AWS Security Token Service (STS) is an AWS service that provides temporary security credentials for accessing AWS resources.
